

Gym application tracker

1. Input:

- Number of activities done
- Type of activity

2. Output:

- The total calories burned
- The average calories burned
- Most calories burned in a specific activity

3. Variables:

- NumAct (Integer)
- Name (Integer)
- TypeAct (String)
- TotCal (Integer)
- AveCal (Double)
- MaxCal (Double)

4. Actions & Events:

- BtnSetUp
Based on the information on TxtName and TxtNumber it will modify the grid based on that info.
- BtnInput
An input box will appear asking for the type of activity the user has done, and the number of calories burned for each activity to display in the grid.
- BtnTA
Calculate the total and average calories burned by the user and display them in the grid.
- BtnMax

Determine the maximum calories burned on a specific activity and display the name of the activity in TxtBestAct.

5. Algorithms:

- BtnSetup is clicked, then the user's info modifies the grid based on the given info in TxtName and TxtNumber.
- BtnInput is clicked, then the user is asked for the number of activities done, type of activity, and the number of calories burned for each activity in the gym and that information is stored in the grid.
- BtnTA is clicked, then calculates the total and average calories based on the information in the grid.
$$\text{TotCal} += \text{Member}(i).\text{Calories}(j)$$
$$\text{AveCal} = \text{Member}(i).\text{Calories}(j) / \text{Member}(i).j$$
- BtnBest
